

CLAIM

What I claim as my invention is a less complicated type of sports equipment comprised of a large drum, capable of holding up to twelve (12) cold and/or wet athletic balls, a heating element, a blower fan, an air filter, and a battery, all housed within a lightweight container. As the balls travel around the drum, they are heated and dried, enhancing the ease and comfort of their use during athletic events held outdoors in severe or adverse weather conditions. This unit will change the performance levels and effectiveness of the athletes involved. This marks a significant advancement and simplification over prior art or the use of plastic or nylon bags that are merely containers to hold wet, cold balls and do nothing to improve player performance.
